Multiple regression analysis was used to quantify relationships between environmental ( independent ) variables and harvest of selected fishes ( dependent variables ) in reservoirs with coolwater, coldwater, and seasonal or two story fisheries. In this procedure, variation in environmental factors is used to explain variation in harvest of fish. The predictive value of any environmental factor is determined by how well a unit change in that factor is related to a unit change in harvest of a particular species. It is assumed that the environmental variables that provide the greatest predictive value are biologically important, although high correlation does not necessarily imply a cause and effect relationship. Multiple regression models relating environmental variables and harvest of selected fishes were developed from the SAS-79 stepwise method of maximum 2 R improvement ( Barr et al. 1979 ). This procedure selects independent vari-ables from all available combinations on...
